

AI Entrepreneur Coach

A trait based business idea recommender

CV and TIPI quiz in · ranked ideas and a 90 day roadmap out

Picking a business idea is usually a guess guess

Generic AI advice is ungrounded, this tool is not.

Ask ChatGPT for an idea and it invents something plausible, not repeatable. This app retrieves from 463 real O*NET-derived ideas instead.

Four real inputs here.

CV or LinkedIn PDF, Big Five quiz (TIPI, 10 items), budget, time available per week.

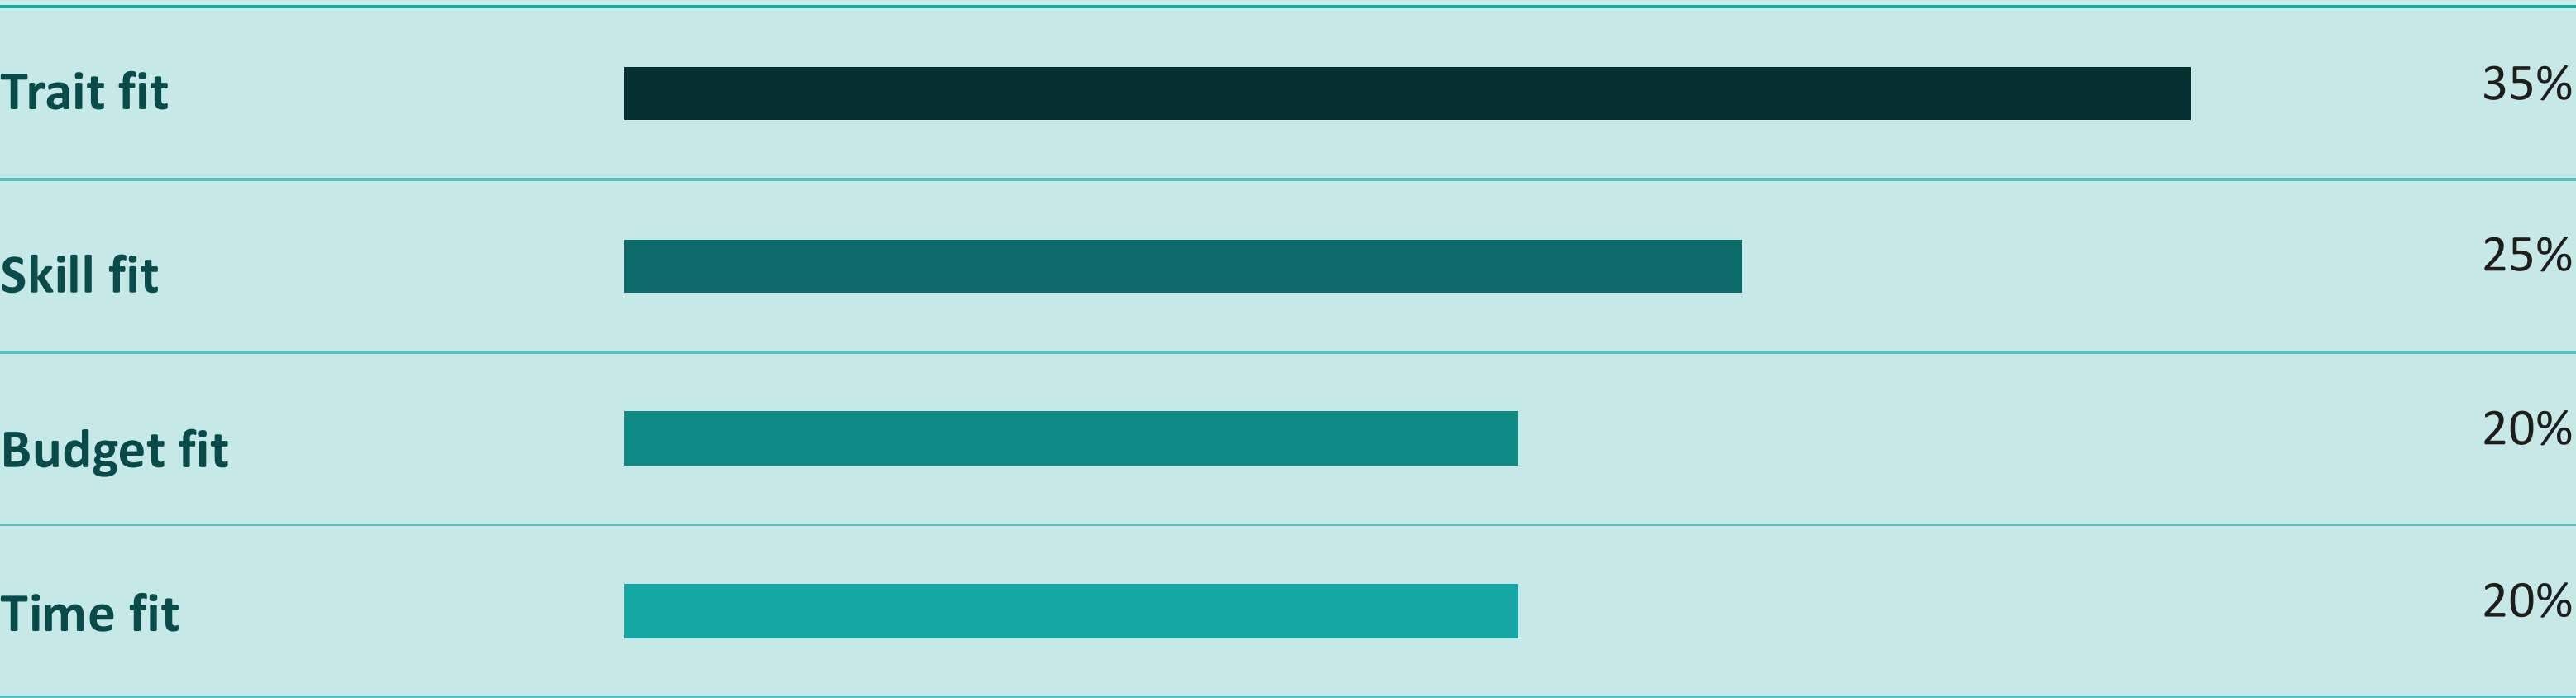

Other tools skip budget and time.

Most recommendation tools ask for a long personality test, or just a CV, rarely for what you can actually afford or how much time you have.

Output.

Ranked ideas with a computed fit percentage, a grounded rationale, and a 90 day roadmap.

Fit score formula

Computed in code, not guessed by the LLM.

LangGraph, not n8n

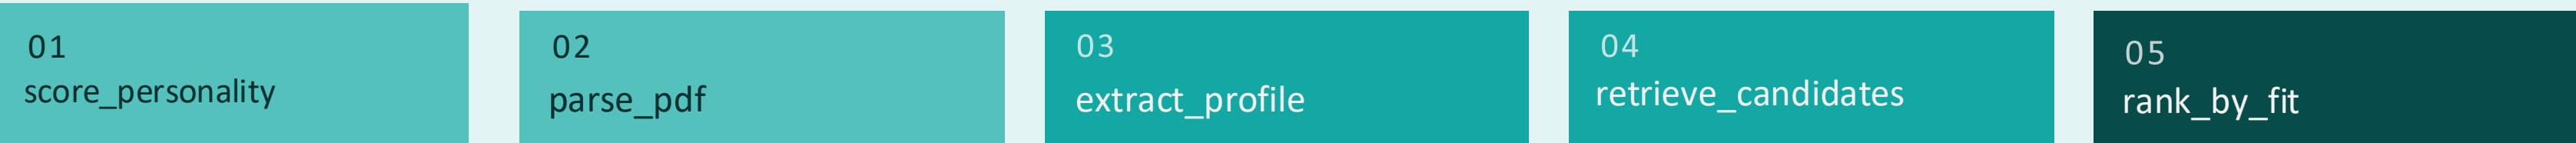

Fixed sequence, not a business process. Parse PDF, extract profile, score personality, retrieve candidates, rank, write report. Real Python data moves between steps, not connector nodes pointing at external business systems.

Typed and inspectable. A real StateGraph with TypedDict state, each step is its own node, testable and debuggable on its own.

n8n was not used anywhere. No CRM, ticketing system, or webhook trigger to connect, not even as a small helper.

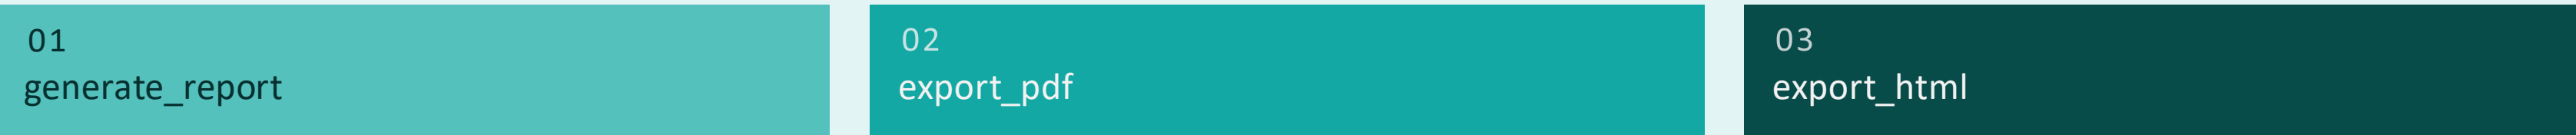

Two LangGraph graphs

RECOMMENDATION_GRAPH

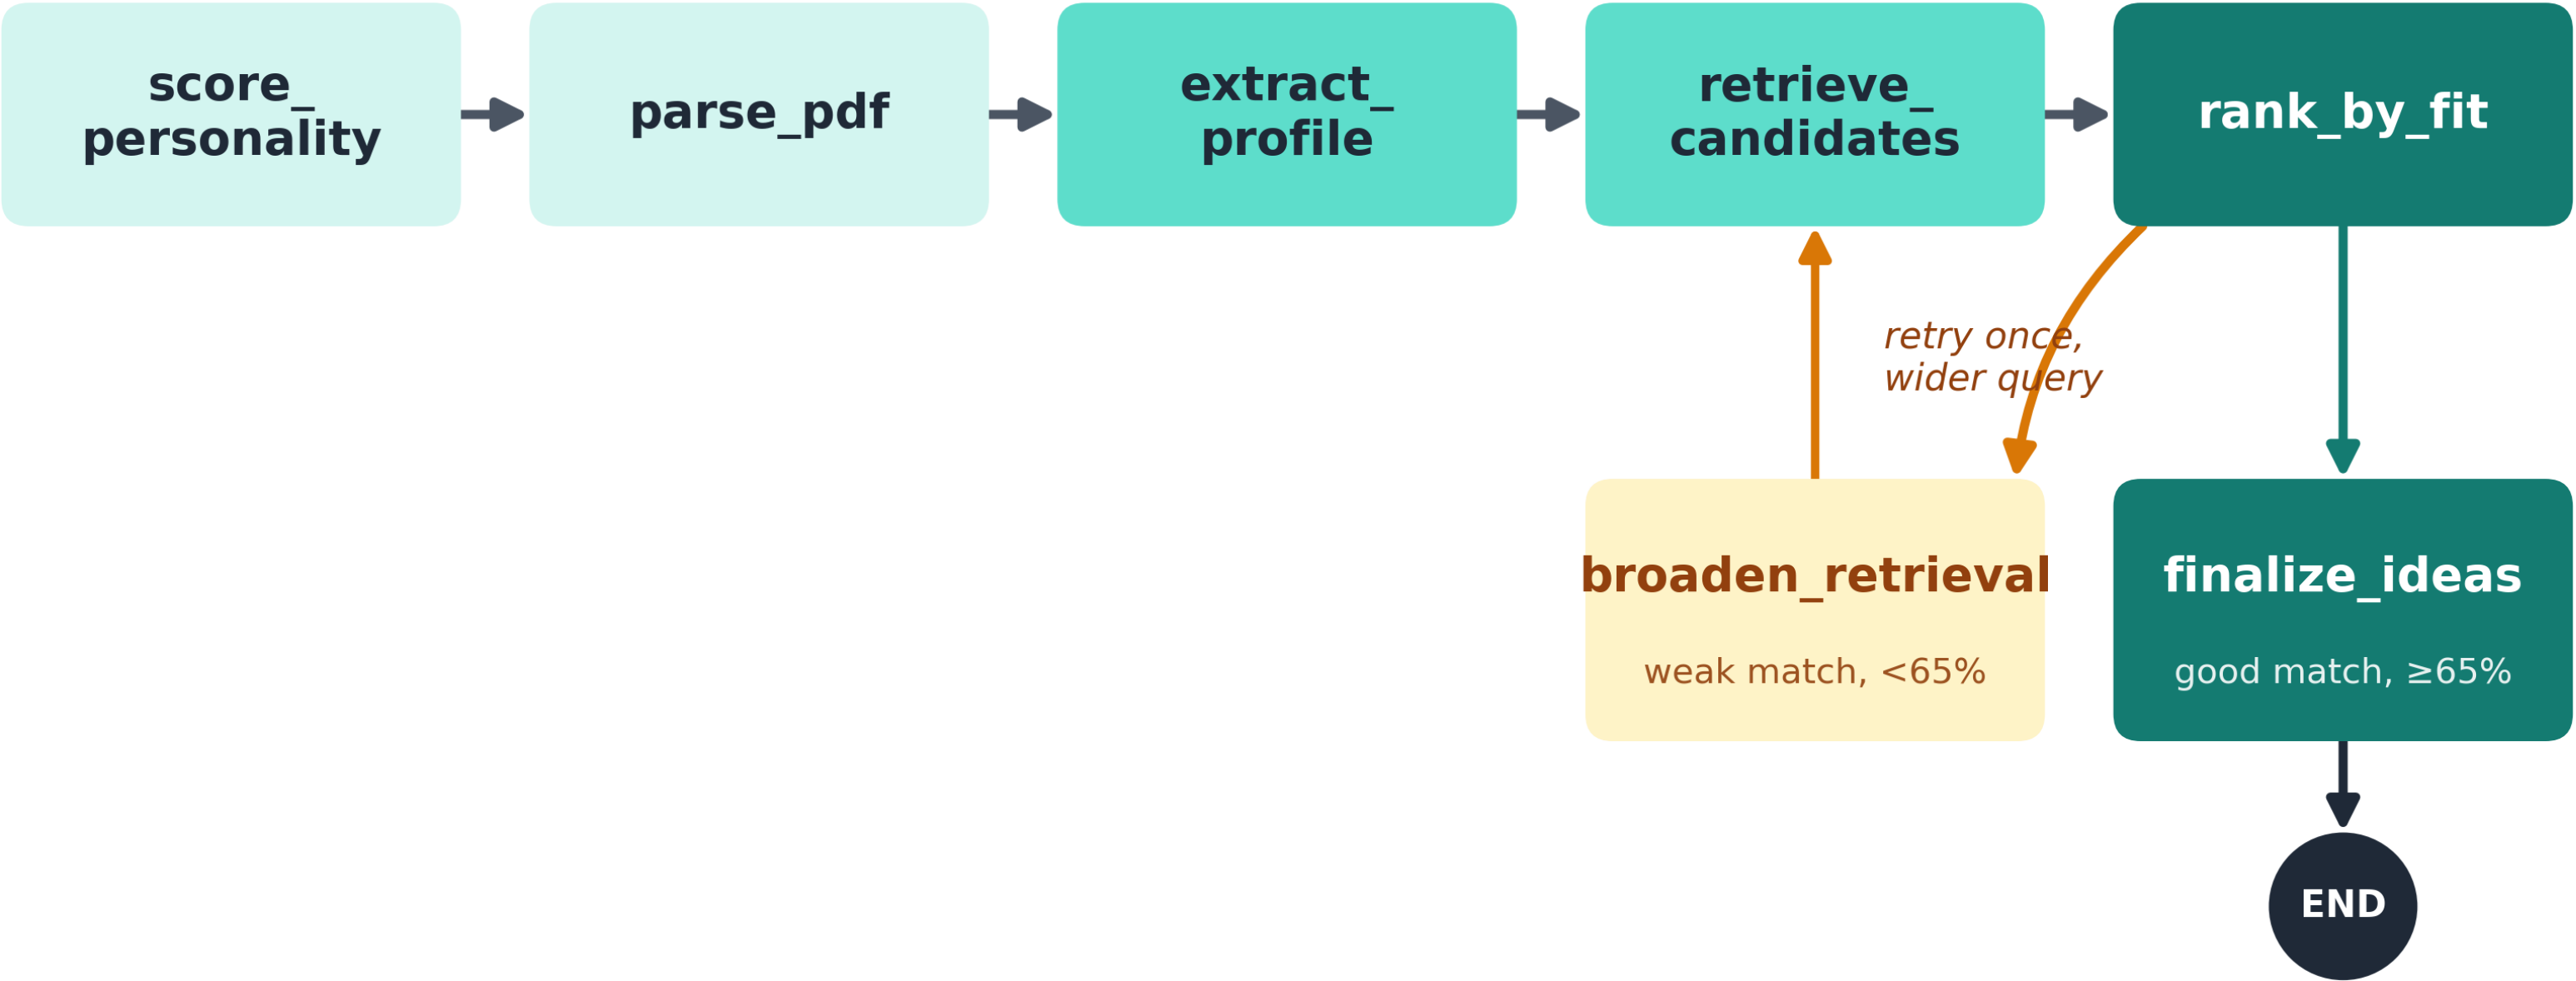

rank_by_fit branches: weak match → broaden_retrieval → retry retrieve_candidates once with a wider query. Good match → finalize_ideas.

COACHING_GRAPH

Feedback loop back into generate_report, up to 3 rounds, never changes the computed fit score. Split at the point the user picks which idea to get a roadmap for, instead of one graph with interrupt().

recommendation_graph

Dataset, Tools and APIs

O*NET dataset. 463 business ideas, one per real occupation, from 20 hand picked plus 472 filtered by job category and job zone.

Retrieval. Cohere embeddings, Pinecone vector search, top 30 candidates per query.

3 real external APIs. OpenAI (extraction, report writing), Cohere (embeddings), Pinecone (vector DB).

Live demo

upload a profile → TIPI quiz → budget and time → ranked ideas → 90-day roadmap

Future GTM sprints

SPRINT 1

Public pilot

Host it publicly, free, direct to consumer.

Goal: 50 completed runs in 30 days,
validate real demand before monetizing.

SPRINT 2

Career coach distribution

Partner mode for career coaches and
outplacement services. Goal: 1 to 2 active
partners, 10 client reports through a
partner link.

SPRINT 3

Local, non-US data

Budget/time estimates are US O*NET
based. Recalibrate against real German
cost data, add a German report option.

IF THERE WAS MORE TIME

Future work

Personality test depth options

TUPI now

user picks speed vs accuracy

Save/resume sessions

Closing the tab today loses everything unless the report was downloaded.

More CV formats and file types

DOCX, plain text, Europass CV, scanned PDFs via OCR.

Connect the roadmap to a real tool

Export the 90 day action items to a calendar or to-do app.

Expand the O*NET dataset

Beyond the current 13 major groups, reframe licensed professions instead of excluding them.

Compare ideas side by side

See 2 roadmaps before committing to just one.

Known limitations

Budget/time ranges are still an AI estimate. Guided by real O*NET signals (job zone, typical work week), but no direct O*NET data on startup cost.

Skill matching has a noise floor. Cohere embedding similarity between any two professional skill lists sits around 0.4 to 0.6, even for a strong match, this is why the fit score leans more on trait and budget/time fit.

WRAP UP

Thank you, questions?
